Eviware™ and PushToTest™ Announce Partnership To Deliver Open Source Test Automation Solutions for Web Services

Users Enjoy Greater Integration Between soapUI And PushToTest

February 4, 2008 – CAMPBELL, CALIFORNIA, USA – Eviware, the world leader in open-source Web service soapUI test automation tools, and PushToTest, the world leader in open-source enterprise Web application, Web service, Ajax, and Service Oriented Architecture (SOA) test automation solutions announced a far-ranging partnership to benefit Information Technology (IT) organizations that are challenged to surface performance and scalability issues with load and performance test automation, regression test automation, and business service monitoring solutions. In a clear win for customers and users, Eviware and PushToTest will build advanced integration between Eviware soapUI Pro and PushToTest and to sell and support test automation solutions in the USA and Canadian marketplaces.

InfoWorld rated PushToTest and soapUI to be "excellent" individually and PushToTest customers are looking for outstanding integration! For instance, many mid-size and large enterprises use soapUI to read Web Service Description Language (WSDL) documents and in a few clicks of the mouse write a multi-step test suite. Using PushToTest these tests run in a test lab of 10 servers to generate 2,000 concurrently running test suites. PushToTest reports then show an SOA environment's scalability index to help plan for hardware purchases and network bandwidth needs.

Under terms of the partnership the Eviware and PushToTest agreement delivers the following to customers and users:

- Eviware and PushToTest to build advanced integration and offer integrated Web Service test automation. While PushToTest version 5.0 currently integrates Eviware soapUI 2, Eviware and PushToTest will build deeper integration to provide support for Mock Services (virtualized services for testing,) advanced reporting for soapUI test suites, and Repository and Scheduler functions for soapUI test suites into upcoming product releases.
- PushToTest to build Eclipse plug-in with advanced integration with soapUI Eclipse Plug-in.

- Continued -

Enterprises are challenged to surface performance and load issues, regression and functional issues, and to accomplish business service monitoring in a Service Oriented Architecture (SOA) environment. Eviware soapUI is the recognized open-source Web service test suite development tool. soapUI users easily work with WSDL and SOAP-based Web services in an entirely graphical environment. soapUI features test suite creation and debugging. For instance, soapUI provides easy Mock Service creation to build virtualized services for test development where the real service is unavailable. PushToTest operates soapUI tests in a distributed test environment and provides hundreds of reports that enable users to do root cause analysis and remediation of SOA performance and regression problems. PushToTest repurposes soapUI tests into Business Service Monitors (BSM) with no additional programming.

About Eviware

Eviware is the company behind soapUI, the popular Open Source Web Service testing tool. soapUI offers extensive functionality for Web Service inspection, functional and other testing, as well as load testing and Web Service mocking. soapUI aspires to be a tool that makes life easier for all Web Service developers, testers and project managers. soapUI is distributed under a LGPL license and with 10 000 weekly downloads soapUI is the most used Web Service testing tool in the world. soapUI Pro is the Professional Version offering support as well as productivity enhancements and unique functionality such as WSDL Test Coverage. Details at <http://www.soapui.org> or <http://www.eviware.com>.

About PushToTest

PushToTest is a professional open-source software publisher of test automation tools, methodology, and training to medium and large sized enterprises, including The Jackson Laboratory, General Motors, TIBCO, and Wynn Las Vegas. PushToTest's mission is to provide flexible open-source test automation solutions that encourage reuse and sharing among software architects, developers, Quality Assurance (QA) testers, and Information Technology (IT) Managers. PushToTest solutions integrate into modern software development environments and leverage agile, test-first, and unit testing expertise into functional tests, performance and load tests, and business service monitoring. PushToTest designed its technology for Service Oriented Architecture (SOA,) Ajax, Web applications, Web services, and REST applications. PushToTest is an extensible framework that is easily extended to handle new protocols, message formats, encoding styles, and test operations. PushToTest is a distributed architecture where tests scale vertically and horizontally. PushToTest solutions have 6 years of development, 5th generation, active development community, and a 3-year product roadmap. PushToTest solutions cost a fraction of competing commercial tools. Established in 2001, PushToTest is an established profitable professional software publisher with more than 160,000 users and thousands of enterprises.

PushToTest is a trademark of the PushToTest company. eviware and soapUI are trademarks of eviware.
